1.   UNREF

This program reads the PRN output file and produces an extract of the Symbol Table containing just the unreferenced labels.

There is a large exclude table which eliminates common labels like register equates and Z390 DSECTs.

There is a copy book included, UNREFUSR.CPY with a dummy entry. This should be used to add your own excludes, which will avoid the need to modify UNREF when it is refreshed.

The macro UNREFTAB now has three forms:
   UNREFTAB name   -- will exclude that label
   UNREFTAB name,GENERIC -- will exclude all labels beginning with name.
   UNREFTAB name,GENEND -- will exclude all labels ending with name.

See the UNREF.BAT file for usage.
   SET PRNFILE= is the input file.
   SET URFFILE= is the output file, the suffix .URF can be changed.

The UNREF program itself has 3 intentional unreferenced labels for verification.
